

Sanket AI

Industrial Knowledge Intelligence - Demo Video Script

6:00 runtime | Team IIITDards | ET AI Hackathon 2.0 | Problem Statement 8

Logline: A maintenance engineer opens seven systems to explain one pump alarm. Sanket AI connects them - traversing the plant's own topology to return a cited, computed root cause in seconds.

HOW TO READ THIS SCRIPT

Each segment has a timecode, a SPEAK block (voiceover, read aloud), and a SHOW block (exactly what to do on screen). TIP lines are delivery notes. A recording checklist and deep-link cheat-sheet are on the last page.

STRUCTURE

0:00 - 0:35	OPENING HOOK - The Problem
0:35 - 1:05	THE INSIGHT - Why this is different
1:05 - 1:35	COMMAND CENTRE - One brain, five capabilities
1:35 - 3:05	FLAGSHIP DEMO - Root-Cause Analysis (the core)
3:05 - 3:55	PILLAR 1 - Ingestion + Knowledge Graph
3:55 - 4:45	PILLARS 2 & 4 - Copilot + Compliance
4:45 - 5:10	PILLAR 5 - The Knowledge Cliff
5:10 - 5:35	BUSINESS IMPACT - What it's worth
5:35 - 6:00	CLOSING HOOK - The vision

0:00 - 0:35 OPENING HOOK | The Problem

35s

SPEAK (voiceover)

An engineer gets an alarm - a critical pump is vibrating. To diagnose it, she has to open seven disconnected systems: P&IDs in one, work orders in another, inspection logs in a third. In asset-intensive industry, professionals spend 35% of their time just searching for information that already exists - and that fragmentation drives up to 22% of unplanned downtime. The knowledge exists. It's just scattered. Sanket AI is the brain that connects it.

SHOW (on screen)

- Title card over a dark P&ID backdrop: "Sanket AI - Industrial Knowledge Intelligence".
- Quick 3-second montage suggesting scattered systems (tabs / folders flicking).
- Fade into the Sanket AI Command Centre loading.

TIP: Keep the tone calm and serious. Land the two numbers (35%, 22%) - they are the brief's own.

0:35 - 1:05 THE INSIGHT | Why this is different

30s

SPEAK (voiceover)

Most tools would answer with a keyword search. But search finds documents - it can't reason about a pipe. A pump's vibration can't be explained without knowing that a valve two nodes upstream is cavitating. So we made the plant's physical topology the thing the AI reasons over - not a filter, the substrate.

SHOW (on screen)

- Command Centre in view. Slowly pan across the KPI tiles (17 assets, 82 documents, 37% compliance).
- Hover the 'Validated evaluation metrics' row so it is clearly visible.

TIP: This is your one-sentence differentiator. Say 'the substrate' with weight.

1:05 - 1:35 COMMAND CENTRE | One brain, five capabilities

30s

SPEAK (voiceover)

This is the command centre. One brain, five capabilities - ingestion, a knowledge copilot, root-cause analysis, compliance, and failure intelligence - across 17 assets and 82 live documents. And these numbers are measured, not claimed: 100% on our benchmark, 100% citation faithfulness, 91% entity-link accuracy.

SHOW (on screen)

- Cursor-circle the five pillar cards at the bottom ('Five capabilities, one brain').
- Cursor-circle the evaluation-metrics row.
- Click 'Run a diagnosis' (or the Diagnose icon in the left rail).

TIP: Reviewers reward validated metrics - linger half a second on that row.

1:35 - 3:05 FLAGSHIP DEMO | Root-Cause Analysis (the core)

90s

SPEAK (voiceover)

Let's diagnose that alarm - P-101A, 47-hertz vibration. Watch what happens. Sanket doesn't search; it traverses the P&ID. It walks upstream from the pump, pulls every inspection log and work order for the neighbours, and correlates ISO-14224 failure statistics. In under four seconds it finds the real cause - and it is not the pump. It's V-201, a control valve one hop upstream, cavitating - and that cavitation transmits as

vibration downstream. Every claim is cited to a real document. And this confidence, 97%, isn't invented by the model - it's computed from evidence: four corroborating documents, a high-severity finding, the ISO correlation, and a confirmed physical path. Here's the live sensor - vibration in ISO-10816 Zone C, climbing toward the trip line. Left alone, this pump trips in about five weeks.

SHOW (on screen)

- In Diagnose, click the 'Pump vibration' sample query, then Analyze.
- Narrate as the trace panel fires tools and the P&ID lights up: P-101A red, V-201 amber, red causal path.
- Causal-chain ribbon appears: V-201 (root cause) -> P-101A (symptom), r 0.72.
- Point at the metric strip (answer time, nodes, docs, cited).
- Scroll to the ISO-10816 zone gauge + vibration trend (rising into the alarm line).
- Scroll to the confidence meter; hover the evidence breakdown chips.
- Click one amber citation chip -> the source-document drawer slides open. Close it.

TIP: This is the money shot. Slow down. Let the graph animation and the confidence breakdown breathe.

3:05 - 3:55 PILLAR 1 | Ingestion + Knowledge Graph

50s

SPEAK (voiceover)

Where does this knowledge come from? Any document. Here's a raw inspection report - it could be a PDF, an email, or a scanned form. Sanket extracts the entities the moment it lands: equipment tags, dates, parameters, personnel, and regulatory references - and links them into the knowledge graph, at 97% F-one. And this is that graph: not just equipment, but documents, failure modes, the people who recorded them, and the regulations that govern them - one connected brain.

SHOW (on screen)

- Left rail -> Ingest. Click a sample document (Inspection Report), then 'Extract entities'.
- Show the extracted entity chips; point out the green ones (linked to the graph).
- Left rail -> Graph. The knowledge graph renders: P-101A at centre, rings of Equipment / Documents / Failure modes / People / Regulations.
- Click one node to open its detail panel.

TIP: Emphasise the heterogeneity ('PDF, email, scanned form') - that is the brief's Pillar 1.

3:55 - 4:45 PILLARS 2 & 4 | Copilot + Compliance

50s

SPEAK (voiceover)

Any engineer - or a field technician on a phone - can just ask. 'What is the condition and history of P-101A?' A cited answer in seconds, drawn from the whole corpus. And compliance is continuous: Sanket maps OISD, the Factory Act, PESO and ISO clauses against every asset's actual evidence, and flags the gaps automatically. This plant is at 37%, with nine high-severity gaps - and one click generates the audit evidence package.

SHOW (on screen)

- Left rail -> Ask. Click the chip 'What is the condition and history of P-101A?' -> cited answer + sources.
- Left rail -> Comply. Show plant compliance 37% and the gaps grid.
- Click an asset (e.g. K-501) -> clause-by-clause status with evidence / gaps.

TIP: Say 'on a phone' while the answer renders - it plants the mobile / field-tech point.

4:45 - 5:10 PILLAR 5 | The Knowledge Cliff

25s

SPEAK (voiceover)

And the hardest problem of all: a quarter of India's experienced engineers retire this decade, taking undocumented know-how with them. Sanket captures it. A retiring foreman's trick - 'always re-clearance the impeller after a cavitation event' - becomes a permanent graph node, instantly queryable by the next shift.

SHOW (on screen)

- Left rail -> Capture. Fill the short form (tag P-101A, the foreman's tip) and submit.
- The capture appears in the list on the right - now part of the graph.

TIP: This is the emotional core of the brief. Deliver it with conviction.

5:10 - 5:35 BUSINESS IMPACT | What it's worth

25s

SPEAK (voiceover)

What is it worth? For a mid-size plant, cutting search time and preventing even a fraction of downtime is worth over two crore rupees a year - and it scales, because the reasoning cost is independent of plant size.

SHOW (on screen)

- Left rail -> ROI. Show the Rs 2.17 Cr headline and the labour / downtime split.
- Optional: flash the Arch view for 2 seconds ('runs with zero external services').

TIP: The rupee number is the Business-Impact (25%) moment. State it plainly and confidently.

5:35 - 6:00 CLOSING HOOK | The vision

25s

SPEAK (voiceover)

Search gives you documents. Sanket gives you answers - cited, computed, and connected across every system a plant runs on. It turns fragmented knowledge into a structural advantage: safer, faster, and impossible to lose. This is the unified asset and operations brain. This is Sanket AI.

SHOW (on screen)

- Return to the Command Centre.
- End title card: 'Sanket AI - Industrial Knowledge Intelligence' + tagline + 'Team IIITDards - Problem Statement 8'.

TIP: Match the opening's tone. End on the product name, silent for one beat, then cut.

Recording checklist

- Run offline & seeded: set SANKET_FORCE_MEMSTORE=1, then `uvicorn backend.main:app --port 8000`.
- Record at 1440p or 1080p, browser at 100% zoom, cursor movements slow and deliberate.
- Pre-stage each segment with a deep-link (below) so transitions are instant - no fumbling.
- Do the flagship RCA live and unedited - the graph animation + streaming is the proof it is real.
- Keep total voiceover ~700 words; rehearse to hit 6:00 exactly. Trim adjectives, not demos.
- Backup: keep a pre-recorded run of the RCA in case of any hiccup on the day.
- Optional lower-thirds captions for the key numbers: 35%, 22%, 97%, Rs 2.17 Cr, 100% faithful.

Deep-link cheat-sheet

Flagship RCA (auto-runs)

`/ui/index.html?q=P-101A%2047Hz%20vibration%20spike.%20Find%20root%20cause.`

Copilot answer (auto-runs)

`/ui/index.html?ask=What%20is%20the%20condition%20and%20history%20of%20P-101A`

Any view

`/ui/index.html?view= (overview | diagnose | ingest | graph | comply | monitor | roi | capture | architecture)`

Word count of voiceover ~700 words -> ~6:00 at a measured pace. Every SHOW action maps to a real feature in the running product. Break a leg.
